Build and test instructions

Install the included upstream generator and pipeline:

```
python -m pip install -e eos_generator/compose_eos_pkg
python -m pip install -e .
```

Run the adapter regression tests:

```
python -m pytest -q pipeline/tests
```

Reproduce source-knot tables from a previously generated matched-EOS tree:

```
python scripts/compose_cowling.py prepare --matched-root /path/to/matched_eos_v3_2 --classif
```

Build the q-linear solver adapters:

```
python scripts/compose_cowling.py build-adapters --prepared-dir data/eos_original_normalized
```

Verify the existing f/p1 spectrum without running any integrations:

```
python scripts/compose_cowling.py verify-existing --release oscillation_release_v1
```

The upstream v3.3.0 generator release records 54 passing tests, compileall, wheel build, wheel installation and CLI checks. The original Cowling source, fpm manifests, fixtures, legacy workflow and completed results are retained. No frequency scan is triggered by installation or verification.
